

## love Dental Implants

Missing teeth can severely influence your daily life. It can affect your general health, your appearance and self-esteem.

### What is a dental implant?

A dental implant is an artificial tooth root made of titanium which replaces the missing tooth. We insert the implant into the jaw bone where the titanium then integrates with the bone. Just like your tooth root did before, the implant then builds a stable foundation for the crown, which will become the visible part of your new tooth.

In some cases just two implants can be used to replace 3-4 missing teeth this is called an implant bridge.

Dental implants are very small, normally around 10mm long and only 3-5mm wide at the top.

A single lost or damaged tooth can influence your daily life. Even though it may be at the back of your mouth and not visible from the outside, over time it can start affecting your appearance, self-esteem, your oral health and even your health in general.

Why our clients  
*love* coming to us...

"I was hoping for a new smile and the difference now is that I feel more confident and I do smile a lot more now."

Lech N

# We want you to *Love* going to the dentist

## The All-on-4® Treatment Concept

The All-on-4® treatment concept is a dental implant solution strategically designed for toothless jaws. If your teeth need to be removed or you no longer want to live without teeth, the All-on-4® treatment concept might be the right solution for you. With only four dental implants, the All-on-4® treatment concept can restore a complete jaw of missing teeth.

This technique offers you several advantages:

### **Shorter treatment time, lower costs:**

The low number of implants needed for the All-on-4® treatment concept considerably reduces treatment time and often makes this solution more cost-effective than comparable treatment alternatives. A very elaborate way of placing implants at the back of the mouth also makes it a treatment option for patients whose jaw bone is severely reduced after years without teeth.

**Fixed teeth from day one:** Depending on your individual dental situation, your dentist can connect your implants to a temporary bridge on the day of surgery. This means you can leave the dental clinic with a full set of teeth and return to leading a normal life. After a certain healing time, your dentist will exchange your temporary bridge with the final bridge created by a dental laboratory.

Speak to us to find out if the All-on-4® treatment concept is the right solution for you.
